

Invitation to the product launch in Rundetaarn (The Round Tower) in downtown Copenhagen: **KATAKA compact actuator**

We have recently finished the development of a new class of linear Electromechanical actuators. It is based on the segmented spindle which is a radical innovation.

The KATAKA actuators are extremely compact: An actuator with a height of 50mm has a stroke of 400mm (or more). KATAKA means "golden chain" in Sanskrit.

This is a new solution to the well-known problem on how to create linear motion within a confined space. It enables completely new design of mechanisms and machines.

More info on: www.kataka.dk and www.rundetaarn.dk/engelsk/frames.htm

We officially launch the product at an event in the historical Rundetaarn (the Round Tower) in central Copenhagen (it has a unique spindle-shaped ramp with 7,5 windings) on **20 August 2008 between 3-6pm.**

You are hereby invited to participate in this event!
